

SHE Teams - IR Analysis & Respondent Database Development

Applicant Name: C Veera Manohar Reddy

Internship Application – Hyderabad City Police

B.Tech CSE (Cyber Security), SRM Institute of Science and Technology

Interested in database systems, analytics, and public safety technologies

My Understanding of the Project

- This project mainly focuses on organizing interrogation reports in a structured and meaningful way so that important information can be retrieved quickly whenever required.
- The respondent database should help in maintaining records securely while also reducing manual searching and repetitive documentation work.
- I believe this project is not only technical but also socially impactful because efficient handling of information can support SHE Teams in faster analysis and decision-making.
- A well-maintained database can also help in identifying repeated complaints, behavioral patterns, and response timelines more effectively.

Approach Towards the Project - Initial Phase

- In the beginning, I would first try to understand how interrogation reports are currently maintained and what type of information is commonly recorded.
- Important fields like respondent details, complaint category, timestamps, locations, and report status would be identified and categorized properly.
- After understanding the workflow, I would design a structured database schema using SQL concepts for organized data storage.
- The focus during this phase would be on maintaining clarity, consistency, and easy retrieval of information.

Implementation Plan - Data Organization

- Once the structure is finalized, I would work on organizing the reports in a searchable and manageable format.
- Basic validation methods can be added to reduce duplicate or incomplete records.
- Python and SQL can be used for sorting, filtering, and processing large amounts of data efficiently.
- The database should also be scalable so that future reports and records can be added without difficulty.

Implementation Plan - Analysis & Reporting

- After organizing the data, the next step would be analyzing trends and generating meaningful reports.
- Using Excel or Power BI, dashboards can be created to visualize case categories, response timelines, and repeated patterns.
- Such analysis may help in understanding operational challenges and improving coordination.
- The overall aim is to make information more accessible and useful for practical decision-making.

Potential Challenges

- One major challenge could be handling sensitive information carefully while maintaining confidentiality and privacy.
- Another challenge may be inconsistent report formats or incomplete entries in older records.
- Managing large amounts of data efficiently without affecting performance can also require proper planning.
- As this project deals with real-world records, accuracy and responsible handling of information would be very important.

Support Required from Hyderabad City Police

- Guidance from mentors regarding the existing workflow and report structure would be very helpful.
- Access to sample or non-confidential data would help in understanding how records are maintained practically.
- Feedback regarding database design and reporting requirements can improve the implementation process.
- Regular interaction with the team would also help in aligning the technical work with practical requirements.

My Availability & Contribution

- I am available to start the internship immediately after the selection process.
- Being genuinely interested in cyber security, databases, and public safety systems, I am willing to dedicate consistent time and effort to the project.
- I can contribute around 20–25 hours per week while balancing academics responsibly.
- I am also willing to learn new tools and adapt according to the requirements of the department.

Skills Relevant to this Internship

- I have working knowledge of Python, SQL, Excel, Power BI, and Tableau, which can be useful for data organization and analysis.
- My academic background in Cyber Security has also helped me understand the importance of secure data handling and privacy.
- Participation in CTF events improved my problem-solving approach and analytical thinking.
- I am comfortable learning independently and working in a structured environment.

Conclusion

- This internship is a valuable opportunity for me to apply my technical knowledge to a socially meaningful project.
- I am particularly interested in understanding how technology and structured data systems can support women safety initiatives.
- Through this internship, I hope to learn practical implementation while also contributing sincerely to the assigned work.
- Thank You
